

Word River

Wordlist and Context Pack Management Software

What does it do?

WordRiver generates JSON outputs of wordlists and collections of wordlists about a particular context (called context packs) that can be used in other applications for purposes of teaching younger children vocabulary.

What else?

In addition to making wordlists and adding them to context packs, WordRiver provides the ability to assign these context packs to various learners and keep track of them. It also allows the exporting and importing of wordlists to and from other applications.
